Over-boarding chutes

Description

Over-boarding chutes are used for loading and offloading a product respectively to and from a vessel. The main purpose of the chute is to offer a smooth and safe transition between the vessel and the transfer platform, which could be another vessel, an onshore factory or the seabed. Chutes may also be used to guide a product over a loading tower.

Blue Offshore is able to provide steel-plated as well as PU-coated roller type over-boarding chutes. Our chutes are generally custom designed to suit the specific product range and to fit the vessel used.

Design Criteria

- Product minimum bend radius
- Product dimensions
- Product type (power cable, flexible pipe, etc.)
- Type of rollers
- Vessel characteristics
- Operating conditions
